

OZONE THERAPY ON CELULITIS DISEASE.

J.L. Cidon.

Madrid, Spain.

Celulitis is a disease due to alterations on the connective tissue. The adipocytes degenerate, growing hard, causing fiber-tissue to appear. "Orange-skin" is a celulitis characteristic, vascular weakness is another because this problem appears, in addition to other causes, due to a bad vein or limphatic flow. The treatment must be focused on:

1st. Removing the causes of the disease.

2nd. Operate over the celulitis mechanism.

3rd. Treat the lesions caused.

Giving a mixture of oxygen/ozone in the celulitis zone causes a very important improvement in the peripheral circulation. As well, ozone is able to destroy the degenerated fat tissue (very important to fight against this problem).
